Summary

Code is cheap now. Knowing what to build is not. I am an AI engineer who works like a consultant, the way a Forward Deployed Engineer (FDE) does: from a one-sentence brief, I find the people who know the workflow, dig into the real pain point, and ship the solution end to end, built around the tools they already use. I follow new AI closely, apply it only where it gives the business an edge, and keep the core simple and reliable.

Experience

AI Engineer Intern, PT Soluix Finteknologi Indonesia – Tangerang 2025 – present

- Received a bonus for the meeting minutes generator, which Soluix valued at about IDR 70 million in saved staff work hours.
- Led 1 of 6 groups in an AI-Driven Development Life Cycle (AI-DLC) workshop with Kiro, an AI coding tool, for about 65 staff.

Education

BINUS University @Alam Sutera, B.Sc. in Computer Science (Intelligent Systems) 2023 – present

- 7th semester. GPA: 3.79 / 4.00. IELTS band 7.5.
- Taught TOEFL preparation as a paid instructor for BINUS English Club (BNEC) for 1 year.
- Won 2nd place and IDR 6 million at Codefest.id Hackathon 14 with "ono", a study app with an LLM tutor (Jun 2025).
- Reached the quarter-final of Samsung Innovation Campus (SIC) with a smart trash bin that sorts waste with an image model and an ESP32 camera (Dec 2024-May 2025).

Professional Projects

Soluix - AI Bug-Reporting System: From WhatsApp Chats to Developer Tickets Sept 2026 – present

- Built an AI agent that turns WhatsApp complaints into complete MantisBT bug tickets, with human approval; shipped the MVP in under 2 weeks, now used by 4-8 staff on a live client project.
- Led the project from a one-line brief: interviewed 5 support and tech staff, found the root cause was communication, and split one overloaded WhatsApp group into a structured WhatsApp Community before adding AI.
- Designed and deployed a 7-container Docker Compose stack on a VPS: web console, WhatsApp, personal-data masking, knowledge base and LLM gateway services on an internal network, reached only through SSH tunnels.

Technologies: TypeScript, Next.js, Python, FastAPI, Model Context Protocol (MCP), Vercel AI SDK, MantisBT API, Docker

Soluix - AI Meeting Minutes Generator for Long Zoom Meetings Apr 2026 – present

- Built a pipeline that turns 1-3 hour recordings into structured minutes with speech-to-text and Claude Sonnet, exported to PDF and Word; deployed on the company AWS EKS cluster.
- Started it without a formal assignment after the Head of HR raised a pain point; shipped in 3 days, now used by 9+ staff, cutting minutes preparation from 100 to 5 minutes per meeting.

Technologies: TypeScript, Vercel AI SDK, FFmpeg, PostgreSQL, Zod, GitHub Actions, Kubernetes, AWS EKS

Tokodrink - WhatsApp Business Virtual Assistant AI Agent July 2026 – Oct 2026

- Built a production-ready WhatsApp Business assistant in n8n for Tokodrink, a 4-branch alcohol drink store, connected to the official Meta WhatsApp Cloud API.
- Designed a lookup sub-agent for the 413-product pricelist, so the main agent quotes real prices and keeps context small.

Technologies: n8n, OpenAI API, OpenRouter, Meta WhatsApp Business API, Docker, Ubuntu VPS

Personal Projects

Fully Local VLM Webcam Captioning: Real-Time, No Internet Dec 2025

- Built a webcam captioning web app with a fully local model, with no internet and no cloud API: Next.js sends a frame every 3 seconds to a FastAPI backend on an RTX 3070 GPU, with captions in under 2 seconds.
- Chose Moondream2, a small vision-language model (VLM), after checking the sizes of Qwen-VL, LLaVA and other Ollama vision models against 8 GB of GPU memory; ran it with NVIDIA CUDA under WSL2 (Linux on Windows).

Technologies: Python, PyTorch, Hugging Face Transformers, NVIDIA CUDA, WSL2, FastAPI, Next.js

Self-Hosted AI Agent (OpenClaw / Hermes Agent Style), Built From Scratch Sept 2026 – present

- Built on WhatsApp with no agent framework: own tool-calling loop on LiteLLM, 41 tools, a main agent and 4 sub-agents.
- Engineered the context window with per-chat memory as a markdown wiki, retrieval-augmented generation (RAG) with keyword search instead of a vector database, and auto-compaction that cut cost per turn from about $0.11 to $0.016.

Technologies: Python, FastAPI, LiteLLM, OpenRouter, WAHA (WhatsApp HTTP API), SQLite, Docker, pytest

Skills

AI: Generative AI, Large Language Models (LLM), AI Agents, Prompt Engineering, RAG, MCP, Computer Vision, Speech-to-Text

AI Tools: OpenAI API, Claude API, Gemini API, Vercel AI SDK, LiteLLM, OpenRouter, Ollama, n8n, LLM Evaluation

Machine Learning: PyTorch, TensorFlow, Hugging Face Transformers, scikit-learn, XGBoost, Pandas, NumPy, CNN, NLP, OCR

Software: Python, Go, SQL, FastAPI, Flask, TypeScript, Next.js, React, PostgreSQL, SQLite, MongoDB, REST APIs, Git, pytest

Cloud and DevOps: AWS (EKS), GCP, Docker, Kubernetes, Microservices, CI/CD (GitHub Actions), Linux VPS, SSH, Cloudflare
